COLUMN 1: WAVE PROPAGATION

Electromagnetic disturbance dynamics

In wave mechanics and spectroscopy,

radiation is characterized by wave vectors

and spatial frequency in dispersive media.

Spatial periodicity is quantified by wave

numbers per unit distance across fronts.

COLUMN 2: OPTICAL WAVENUMBER

Mathematical formulation in vacuum:

FORMULA (104.2):

$$\tilde{\nu} = 1 / \lambda$$

Optical Symbol Ambiguity Warning:

In older archival typography, symbol ~nu may resemble tilde nu (wavenumber) or nu_0 (threshold frequency). Inspect crop.

where lambda denotes vacuum wavelength.

Planck Black-Body Radiation Law (Rotated Orientation Archive)

Planck's radiation law describes spectral energy density of black-body radiation

at absolute temperature T. Spectral energy distribution across wavelengths satisfies

the Planck distribution function.

Archival Fragment 3: Degraded historical manuscript with severe ink bleeding.

Line localization confidence is below reliable threshold.
